## TECHNICAL DATA SHEET

## 1. General warnings

This technical data sheet contains technical information concerning silencers for PVT and HELIX series lobe vacuum pumps and the main installation and maintenance instructions.

Complying with the instructions contained in this technical data sheet is crucial for the warranty on defective parts. Upon receiving the goods, ensure that they are intact and have not been accidentally damaged during transport. In the event parts of the accessory must be replaced, **only use original spare parts**.

## 2. Technical data

The PVT and HELIX silencers are designed to be installed in correspondence with the discharge (standard silencers) or injection line (both standard and compact silencers) of lobe vacuum pumps without lubrication (typically of the PVT-HELIX Series), used to create a vacuum inside tanks.

The compact injection muffler replaces the standard injection muffler. It is installed on the PVT-HELIX side. The suction group is developed to make the installation easier on stationary or mobile vacuum-pressure plants, conveying air.

The PVT-HELIX silencers carry out two main functions:

- Attenuate the noise produced by decompressor operation;
- Filter the suctioned air (at injection) in order to prevent powdery particles over a determined size from entering the pump, thus compromising its operation.

Standard PVT-HELIX silencers are available in six categories:

- **Standard PVT200-280, HELIX140-...-300 Silencers** made of painted S235JR mild steel and Stainless Steel AISI 304L;
- **Standard PVT400, HELIX450 Silencers** made of painted S235JR mild steel and Stainless Steel AISI 304L;
- **Standard PVT700, HELIX550-750 Silencers** made of painted S235JR mild steel and composite material ("ultralight");
- **Standard PVT1000, HELIX1200 Silencers** made of painted S235JR mild steel and Stainless Steel AISI 304L;
- **Standard HELIX1500 Silencers** made of painted S235JR mild steel and Stainless Steel AISI 304L;
- **Standard HELIX2000 Silencer** made of painted S235JR mild steel.

Each category has the following two types:

- **Filtered:** for injection installation (for all pumps) or to the discharge (for ATEX pumps, should they also be able to work under pressure, e.g. during tank draining operations);
- **Non-filtered:** for discharge installations (with the exception of ATEX pumps in which operation under pressure is provided for).

All silencers are equipped with UNI 2277-67 coupling flanges.

Filtered silencers have a Mesh 120 filtering degree.

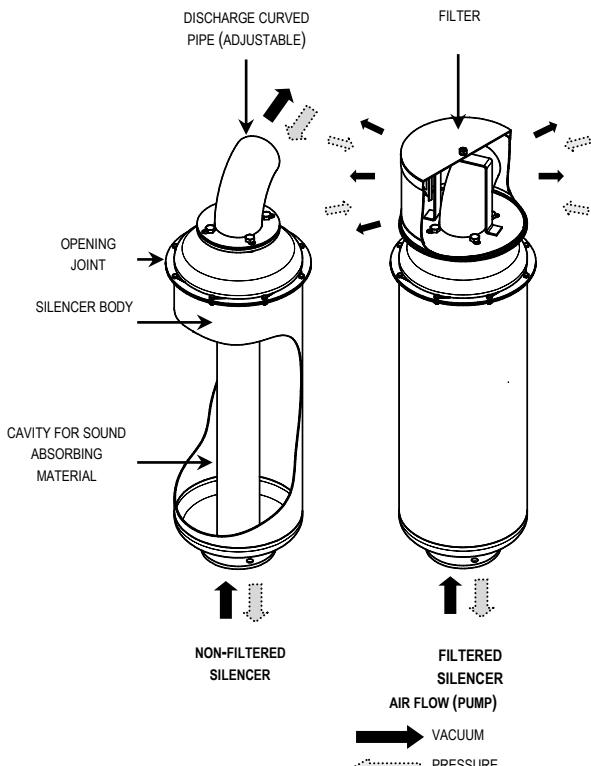

*The figure to the side displays a schematic diagram of two standard silencers (e.g. installed to the discharge), highlighting the main features.*

The **Compact PVT / HELIX Silencers** are made of painted S235JR mild steel and are available for the following vacuum pumps: PVT200-280-400-700 and HELIX140-180-220-300-450-550-750.

Each category has the following two types:

- **Filtered:** for injection installation (for all pumps) or to the discharge (for ATEX pumps, should they also be able to work under pressure, e.g. during tank draining operations);
- **Non-filtered:** for discharge installations (with the exception of ATEX pumps in which operation under pressure is provided for).

Filtered silencers have a Mesh 120 filtering degree.

The following table shows the main operation parameters and the possible combinations with different types of Jurop pumps:

SILENCERS						PVT / HELIX PUMP

○ Ab Only possible to couple if the pump is without 4-way valves (decompressor operation under pressure is not allowed).

<sup>1</sup> When choosing between a radial / axial silencer (D.500) and a radial / radial silencer (D.600), it is recommended to consider the vacuum line type and diameter of the tank. The D.500 silencers are recommended in case of large tankers set-ups.

### 3. Installation

PVT-HELIX silencers are designed to be installed in correspondence with the discharge and injection line (depending on the choice of model) of lobe vacuum pumps (without lubrication).

To ensure attenuation of the noise produced by the decompressor, we recommend installing the silencer as close as possible to it and minimising the hose sections in the line.

The discharge silencer (when assailed by decompressor discharge airflows) is subjected to the passage of high-temperature air that may cause overheating.

**Attention: place the silencer out of the reach of operators or provide suitable guards.**

An adjustable curved pipe is installed on the outlet of the silencer, in order to prevent rain from entering and to enable positioning of the output airflow. Pay special attention to the fumes suctioned by the vacuum pump and emitted through the silencer.

**Attention: direct the silencer discharge away from operators and from the intake duct of the vehicle engine.**

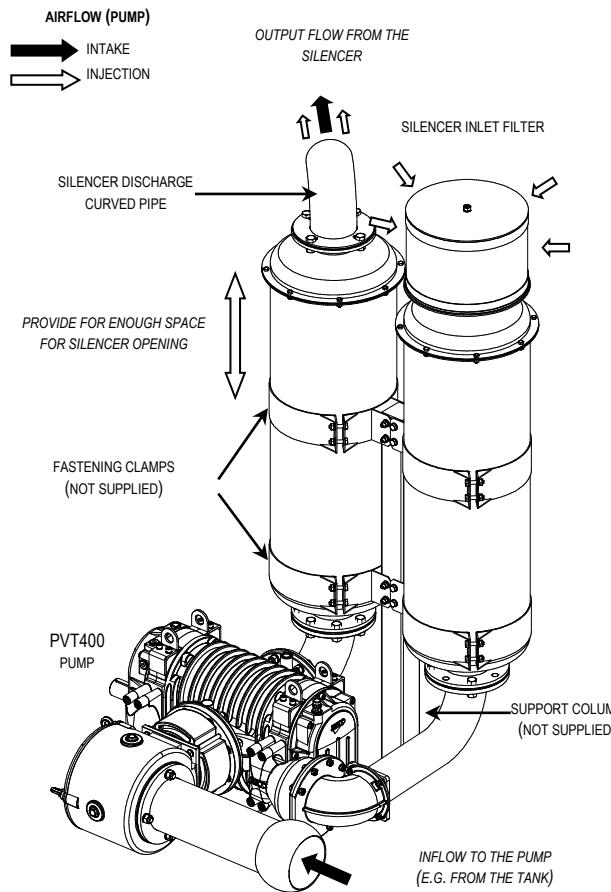

Direct the silencer discharge output away from the silencer suction inlet in order to prevent the input of hot fluids into the injection inlet.

The following table shows the correct installation position for the different types of standard PVT-HELIX silencers (input always facing downwards).

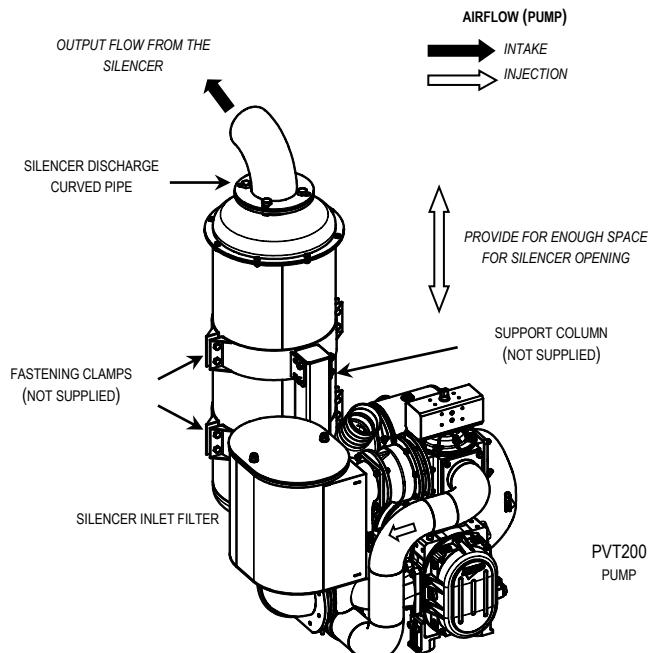

Silencer	Horizontal Inst.	Vertical Inst.
PVT200-280, HELIX140...-300		•
PVT400, HELIX450		•
PVT700, HELIX550-750	•	• (*)
PVT1000, HELIX1200	•	
HELIX1500	•	
HELIX2000	•	

(\*) Installation is only permitted for silencers in mild steel; for vertical installations, provide for a discharge valve for any accumulated materials in the silencer in correspondence with the threaded sleeve placed below.

The figure below shows a schematic diagram of a possible correct installation of silencers for a standard PVT400 pump (therefore, the use of a non-filtered silencer to the discharge is permissible). In order to be installed correctly, silencers must be supported by means of clamping points, e.g., with metal clamps (refer to the figure on the side), or with special support systems.

The figure below shows a schematic diagram of a possible correct installation of compact silencer for a standard PVT200 pump (therefore, the use of a non-filtered silencer to the discharge is permissible). In order to be installed correctly, silencers must be supported by means of clamping points, e.g., with metal clamps (refer to the figure on the side), or with special support systems.

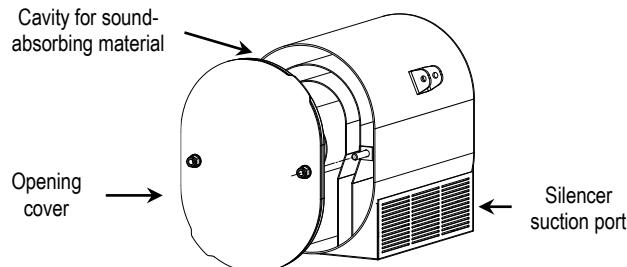

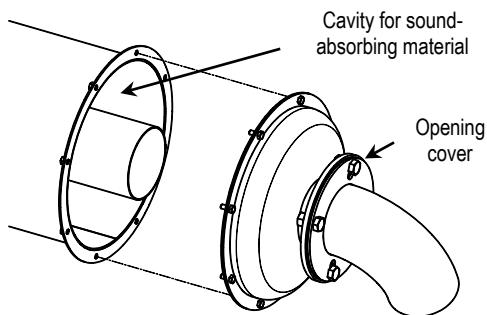

PVT-HELIX series silencers can be opened (with the exception of the compound material version), thus enabling any worn sound-absorbing material to be replaced. You are, therefore, advised to position the silencer in such a way that the removable cover is sufficiently accessible.

The compact injection silencer is installed on the PVT-HELIX side. Provide enough space for air injection. An inefficient air injection could cause the vacuum pump overheating during the vacuum operation.

#### 4. Maintenance

PVT-HELIX silencers are equipped with an opening cover (with the exception of compound material versions) to enable replacement of the worn sound-absorbing material (mineral wool) inside.

Remove the fastening screws (8 or 12, depending on the model) of the cover and open the silencer. Replace the worn sound-absorbing material inside. Once the worn material has been removed, proceed in washing the inside of the silencer.

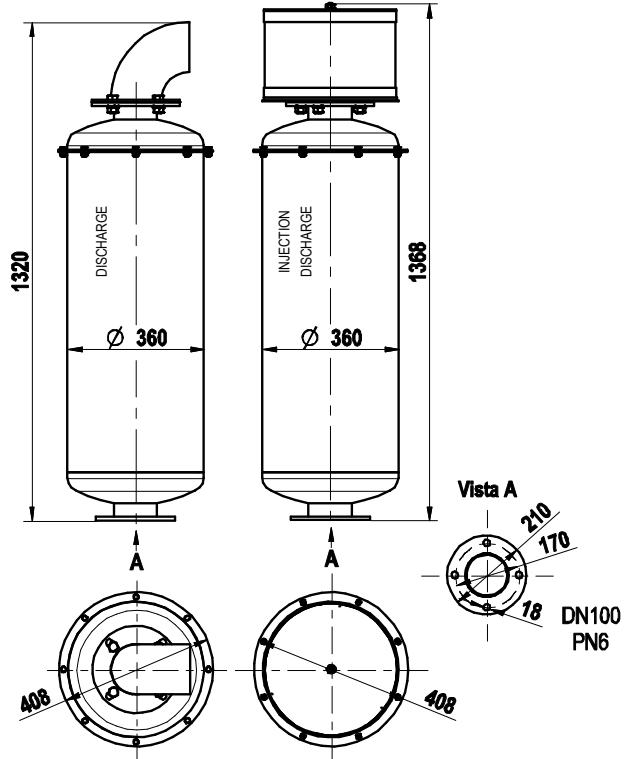

To order replacement material, supply the following code:

**Mineral wool** code 4022213600, refer to the following page for quantities.

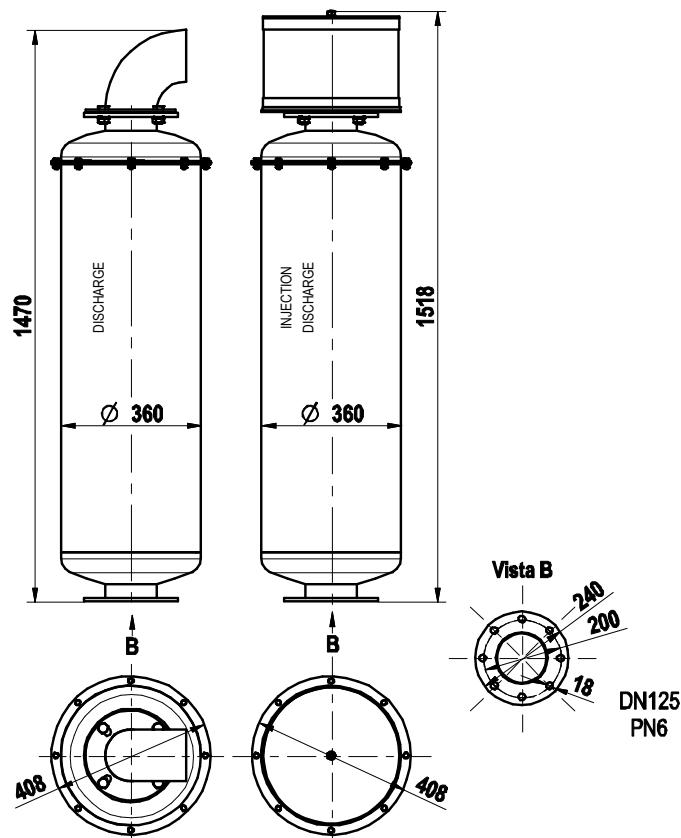

Check weekly the cleanliness of the silencer suction port. Remove all the filth that obstruct the air-flow.
